

**OFFICE OF FINANCIAL MANAGEMENT
FORECASTING DIVISION**

Forecast of the State Population

NOVEMBER 2005 FORECAST

FORECAST OF THE STATE POPULATION BY AGE AND SEX: 1990 TO 2030

NOVEMBER 2005 FORECAST

Technical Notes

1. The forecast for 2001 through 2030 is based on Census 2000 population counts by age and gender. Similar to prior releases, population estimates for 1991 through 1999 are also provided. The revised series is based on the 1990 and 2000 census counts and data that track annual change through the decade.
2. The **natural increase** component of population change includes actual vital events through December 2003. Final 2004 vital statistics data were not available. Provisional data were used. Forecast fertility and mortality assumptions track with Bureau of the Census assumptions with adjustments made for Washington.
3. Forecast **net migration** is based on an econometric model relating Washington's net migration to traded sector employment change. "Traded sectors" are those which export goods and services to other states and abroad. Modeled annual near-term migration carries through by year to 2008. Annual migration is then transitioned to an averaged net migration of 48,100 per year. Historical migration rates are also used to develop the long-range averaged migration expectations.
4. The migration model relates the attractiveness of Washington's employment opportunities—in terms of employment change—to job opportunities in California and the nation as a whole. Briefly, the model specifies that the civilian net migration level is determined by three factors:
 - The relative growth of "traded sector" employment in Washington State to that in the U.S. as a whole.
 - The relative growth of "traded sector" employment in Washington State to that in California.
 - The U.S. unemployment rate.
5. The forecast input data comes from Office of Financial Management's (OFM's) long-term forecast of the state traded sector employment, the Office of Forecast Council's (OFC) short-term economic forecast for the state, and the Global Insight's long-term economic forecast for California.
6. Input data for 2005 are the OFC September 2005-forecasts for the U.S. basing on a high-oil price assumption and the Global Insight's September Forecast for California.

Elderly Population	13
Graph. The elderly population will grow rapidly after 2005.	
Estimates and Forecasts: 1990-2030.....	14

General Discussion of State Growth

Washington's population has increased by about 20 percent per decade from 1960 through the year 2000—adding a total of 1,027,500 over the 1990s. After a slow start, state growth is increasing, largely due to migration gains, and the 2000 decade may show comparable growth. Washington's population is now forecast to increase by 917,000 over the current decade and reach over 6.8 million by 2010.

Washington State shows strong historical population growth.

The Office of Financial Management updates the state population forecast each year to anticipate forthcoming changes in budget expenditures. Persons in certain age groups, such as school-age children, young male adults, or the elderly, drive expenditure needs for schools, correctional facilities, nursing homes, and other programs.

Population growth due to migration is driven primarily by employment opportunities. Washington's economic upturn started with improved employment figures in June 2003 and continues to outpace the economic recovery in nearby states and the nation as a whole. Over the last year Washington added 85,000 new jobs—an increase of 3.1 percent. This compares to a national job growth of 1.7 percent over the same period. As Washington's economy improved, annual migration gains climbed from 22,000 in 2003 to 50,600 in 2005, and are expected to near 80,000 in 2006.

Even these migration expectations may be conservative. Migration was increased last year in the fall 2004 forecast update, but higher enrollment levels in K-12 and continued economic growth indicated migration should again be raised.

Migration revised upward in 2006 state population forecast.

There have also been recent increases in resident active-duty armed forces in Washington, namely the Stryker Brigade at Ft. Lewis, which may continue.

While current employment forecasts for California and the U. S. show Washington is in a good position to continue drawing larger numbers of newcomers—economic forecasts are often subject to change. For this reason, the high migration levels for 2006 and 2007 are slowly transitioned to a lower historically based average—annual net migration of 48,100 per year through 2030.

The interstate movement of licensed drivers supports the continued increase in net migration to Washington. The following chart plots out-of-state licenses that are surrendered to obtain a Washington license—less Washington licenses surrendered in other states. It should be noted the bulk of the increase in the state's resident active military personnel—up from 53,000 in 2004 to about 56,000 in fall 2005—is not captured in the license data.

Washington—Net drivers' licenses surrendered.

Drivers' license data also show California contributes the largest share, about 40 to 50 percent, of the movement into Washington from other states. Current numbers of licenses surrendered from California—a 12-month total of 34,800 licenses—compare to a peak of about 40,000 in early 1991. The economy of such a large and populous neighbor as California has considerable effect on Washington's growth.

Drivers' licenses surrendered show California and Oregon to be the leading contributors to elevated migration levels.

Since young adults and young families are the most mobile segments of the population, changes in the level of net migration to Washington may have a considerable effect on state service demands. Increased migration levels now show 1,157,500 school-age youngsters by 2010—35,000 more than in the state forecast prepared two years ago when the economy began to rebound. Children returning to private schools with improvements in the Puget Sound economy are offsetting some of the impact on public kindergarten through 12th grade education. The population groups affecting post-secondary education, corrections, and other service areas also show increases.

The following sections discuss the specific components of population change.

Components of Population Change: 1990 to 2030

	Population At End Of Period	Population Number	Change Percent	Components of Change from Previous Period							
				Births		Deaths		Natural Increase		Net Migration	
				Number	Rate	Number	Rate			Number	Rate
1990-1991	5,021,335	154,643	3.18	79,076	15.99	36,575	7.40	42,501	112,142	22,68

Office of Financial Management, Forecasting Division
November 1, 2005

Population and Components of Change

The components of population change are births, deaths, and migration. The excess of births over deaths is called natural increase. Persons moving to Washington (in migration) minus persons leaving the state (out migration) result in net migration. The table on the facing page shows the components of population change for 1991 through 2030. Births from 1990 through 2003 are actual vital events. Vital events for 2004 are provisional.

Natural increase will continue to be an important source of population growth.

Fertility

Historical fertility levels in Washington, as in the nation, have followed a roller coaster pattern. However, since the mid-1980s, the state's total fertility rate (TFR)—the average number of births per woman—has remained relatively constant. The average number of births per woman is actually a hypothetical value. It is the average lifetime births expected by a group of women if they followed the actual age-specific birth rates for a given year.

Actual birth levels in Washington increased and then stabilized as the Baby Boom generation aged to have children. Births are expected to rise again as this new group of youngsters reach adulthood and begin their families. Thus, even though the TFR is expected to remain relatively constant, changes in the number of women of childbearing age will continue to cause some fluctuation in fertility levels. The following outline shows some of the historic fertility peaks and valleys.

Number of births per woman is expected to be low but a large number of women will have children between 2000 and 2030.

Year	Social and Economic Climate	Number of Annual Births	Average Number of Births Per Woman
1933	Bottom of the Depression	20,800	1.6
1957	Peak of Baby Boom, economic prosperity	65,900	3.7
1975	Increases in working women, increased age at first marriage, and delayed childbearing.	49,500	1.7
1980s	Children of the Baby Boomers reach adulthood.	68,000 to 71,000	1.8 to 2.0
Early 1990s	Slight rise in fertility rates, delayed first/or second births recognized.	79,000 to 80,000	2.0 to 2.04
Late 1990s to 2005	Modest fluctuations in fertility levels. Fewer women in peak childbearing age. Birth rates declined in 2001 and showed a marked decline in 2002 for nearly every five-year age group. However, actual births rose indicating no downhill trend.	77,000 to 80,900	1.93 to 1.94 in 2004 to 2.0 2005
-----Forecast-----			
2006-2030	Fertility levels follow U.S. Census Bureau national forecast assumptions with downward adjustment for Washington.	Expectations are for a gradual increase to 106,000 by 2030	Remain at about 2.0 through 2030

If women were currently having children at birth rates comparable to the Baby Boom years—births would total 145,000 per year. By the year 2030 there would be nearly 200,000 births per year. There is no indication that high fertility rates will return—not given the high level of women's participation in the labor force, delayed marriage, and delayed childbearing after marriage.

Mortality

The first half of the 1900s saw dramatic improvements in nutrition and health care that reduced infant deaths and markedly increased life expectancy. After that time, gains in infant health and life expectancy continued, but at a slower pace. Infant death rates are now quite low. Bureau of the Census research indicates, from the late 1990s forward, no medical breakthroughs are anticipated that will greatly increase life expectancy. Gains in life expectancy are expected to come from improved maternal health care, lifestyle changes, and treatment of hypertension.

The following outline shows improvements in life expectancy over time and future expectations.

Year	Infant Mortality/Comments	Number of Annual Deaths	Life Expectancy in Years	
			Male	Female
1920s	Large proportion of deaths to infants in first year of life—approximately 56 per 1,000.	15,000	58	60
1960	Major advances in nutrition and medicine occurred between 1920 and 1960. Infant mortality reduced to 23 per 1,000.	26,500	68	75
1980	Infant mortality reduced to 12 per 1,000.	32,000	72	79
Late 1990s through 2005	Large improvements in life expectancy unlikely. Infant mortality 8 per 1,000. Mild winters and mild flu seasons may cause annual reductions in mortality.	43,000 to 45,900 in 2004. Temporary decline to 43,900 in 2005.	74	80
	-----Forecast-----			
2006	Forecast follows U.S. Census Bureau's recent national forecast assumptions.	48,700	75	81
2015		56,000	76	82
2025		68,600	77.5	83
2030		77,100	78	84

Migration

Migration, the most variable component of population change, is largely an economic phenomenon relating to push and pull factors. Migration usually varies as the result of changing economic conditions in Washington relative to other states. Some migration, such as military movements or the migration of retired persons, is not economic.

Annual migration is developed separately for three time periods: (1) historical and current estimates, (2) near-term projections, and (3) long-term projections.

Net migration is a major contributor to population change in Washington.

Year(s)	Method	Distinguishing Characteristics Of Method	Data and Assumptions (if applicable)
1990 through 2000	Census and Intercensal Estimates (Provisional)	<i>Decade population change from census counts with estimates of annual change based on actual change in symptomatic data</i>	School enrollment and housing
2001 through 2004	Estimates	Developed from Component Method II, the Housing Unit Method, and Regression	School enrollment, housing, vital events, auto, registration, voters, drivers licenses, Medicare data, and others
2006	Estimate (Provisional)	Developed from Component Method II	Provisional school enrollment, vital events, and Medicare
2007 and 2008	Cohort Component Model	Migration forecast is based on an econometric model relating net migration to the performance of Washington's change in traded sector employment compared to that in California and the rest of the nation. <i>The first year of the model overlaps and is consistent with the 2006 provisional migration and population estimate.</i>	Economic and Revenue Forecast Council Sept. 2005 employment forecasts for the state and U.S. with high oil price base assumptions Global Insight's September forecast for California The strength of Washington's traded sector job growth is forecast to be stronger than California's and the U.S. as a whole
Transition period 2009 through 2013. Long-term projection, 2014 to 2030	Cohort Component Model	Developed from a combination of the regression model and historical migration trends to stabilize migration for the lengthy forecast period. <i>Results are expressed as average annual migration.</i>	

Comparison of actual and predicted migration using OFM's model, 1976-2005.

Projected migration is modeled with econometric techniques that integrate economic performance expectations with population outcomes by quantitatively relating changes in traded sector employment to net migration. Briefly, the migration model relates the attractiveness of Washington's employment opportunities—in terms of employment change—to job opportunities in California and the nation as a whole. The model specifies the civilian net migration level is determined by three factors:

- The relative growth of “traded sector” employment in Washington State to that in the U.S. as a whole.
- The relative growth of “traded sector” employment in Washington State to that in California.
- The U.S. unemployment rate.

The forecast input data comes from the Office of Financial Management's long-term forecast of the state traded sector employment, the Office of Forecast Council's (OFC) short-term economic forecast for the state, and the Global Insight's long-term economic forecast for California.

Input data for 2005 are the OFC September 2005-forecasts for the state and for the U.S. based on a high oil price assumption and the Global Insight's September Forecast for California.

“Traded” industries include manufacturing, federal civilian government, and producer services (services purchased by businesses). Changes in state traded sector employment are closely associated with varying levels of net migration over time.

The long-term projections represent the results of a modeled migration developed in 2002. These regression results were retained for the long-term projection because they were developed from more consistent long-term employment projections and the results were consistent with Washington historical net migration performance. Assumptions in *long-term employment expectations* that determined the long-term migration are specified below.

- **Washington is expected to out-perform the U.S. in the growth of the traded sector employment.** This makes Washington an attractive place, economically speaking, for potential migrants.
- **Growth in manufacturing employment in Washington is expected to perform better than in the U.S. and California.** The forecasts for California and the U.S. show a long-run decline in manufacturing employment. In Washington, manufacturing employment is predicted to maintain a small but positive rate of growth. Historically, manufacturing employment in Washington, excluding aerospace and lumber and wood products, has always grown faster than in the U.S. This trend is expected to continue.
- **Employment growth in traded services in Washington is expected to perform better than the U.S. traded services employment in the early years of the forecast.** Historically, Washington has experienced significantly faster employment growth in producer services than the U.S. This is expected to continue with the difference declining. In the last ten years of the forecast period, the producer services sector in Washington is projected to grow at about the same rate as the U.S.

Population in Selected Age Groups

Changes in the number of persons in selected age groups will place new demands on and make new contributions to society, the economy, and government. Of special interest are: children ages 5 through 17; young adults ages 18 through 24; various groups of working-age adults, ages 18 through 64; and the elder population, ages 65 and over.

School-Age Children

There are an estimated 1,124,620 youngsters ages 5 to 17 in 2005. This school-age population is now expected to increase to 1,157,540 by 2010. Increases in migration expectations over the last two years have added 35,000 more school-age children by 2010. Gains in school-age children have only averaged 800 per year from 2000 through 2005. After 2010, as the "Baby Boom echo" children reach childbearing age, K-12 enrollments will show substantial annual increases. The largest increases, those of about 17,000 per year, occur from 2018 through 2021. Historically, the most rapid increases occurred during the 1990s with a 10-year gain of almost one-quarter million school-age children.

The school-age population will grow slowly in the early part of the forecast and then more rapidly after 2010.

Young Adults

After a long-term decline, the number of young adults ages 18 to 24 began to increase in 1997. There are an estimated 627,560 persons age 18 to 24 in 2005. This age group exceeded its prior 1981 peak of 557,200 in 2000 and will continue increasing for the next ten years—reaching a second high of 694,750 by 2012. Post-secondary educational institutions should experience enrollment pressure as the size of this young adult population increases. This post-secondary education age group will then decline through 2018 before it begins to rise again.

Young adults reached a low in 1996 and then grow steadily through 2012.

Working Age Adults

Persons of prime working age—ages 25 to 44—experienced a short term decline from 1,831,100 in 1997 to 1,775,090 in 2005, but should then start increasing and reach 2,104,570 by 2020 and nearly 2,223,000 by 2030. As the Baby Boom generation ages, older workers, persons between 45 and 64, will grow from 1,611,000 in 2005 to a peak of 1,928,440 in 2017.

Prime working-age adults start increasing in 2005 and reach nearly 2.2 million by 2030.

Elderly Population

Washington's population age 65 and over, estimated at 711,810 in 2005, is expected to reach 817,430 by 2010, 1.2 million by 2020 and nearly 1.7 million by 2030. The population age 75 and over shows the most rapid growth after 2015 when the Baby Boom generation has its impact. Persons age 85 and over are estimated at 104,420 in 2005 and are expected to reach 141,090 by 2020, and over 200,000 by 2030.

The elderly population will grow rapidly after 2005.
